Correct bracketing

CodEx — Exercices de programmation

Consider strings made only of parentheses `( )`, square brackets `[ ]` and curly braces `{ }`. Such a string is correctly delimited if :

— for each delimiter, there are as many closing ones as opening ones ;
— reading the string from left to right, for each delimiter, the number of opening ones is at every moment at least the number of closing ones ;
— delimiters do not cross : for example `[(])` is incorrect.

Write a function `est_bien_delimitee(expression)` that returns `True` or `False` depending on whether the string `expression` is correctly delimited.

Examples : `([()[]]{()})` gives `True` ; `{}[(])`, `[][` and `[]]` give `False`.
