Insertion sort

CodEx — Exercices de programmation

Insertion sort relies on a double traversal of the list :

— a left-to-right traversal, starting at the second element, with an index i ; the list is known to be sorted up to index i excluded ;

— a right-to-left traversal, with an index j, to insert the element of index i at the right place in the already sorted part.

Write a function `tri_insertion(tableau)` that sorts the list of numbers `tableau` in place, in increasing order, with this method (no need to return it).

Examples : `[9, 5, 8, 7, 6]` becomes `[5, 6, 7, 8, 9]` ; `[2, 5, -1, 7, 0, 28]` becomes `[-1, 0, 2, 5, 7, 28]` ; `[9]` and `[]` do not change.
