Number Theory — problem 6.155

A. Engel — Problem-Solving Strategies · 1998

Let $D(n)$ be the digital sum of the positive integer n.

(a) Does there exist an n such that $n + D(n) = 1980$?

(b) Prove that at least one of any two successive positive integers can be represented in the form $E_n = n + D(n)$ (AUO 1980).
