Games — problem 13.21

A. Engel — Problem-Solving Strategies · 1998

Initially there is a chip at the corner of an $n \times n$-chessboard. A and B alternately move the chip one step in any direction. They may not move to a square already visited. The loser is the one who cannot move. (a) Who wins for even n? (b) Who wins for odd n? (c) Who wins if the chip starts on a square, which is neighbor to a corner square?
