Avoiding triples

Animath — Stage olympique de Sophia-Antipolis · 2006 · France

Let A be a set with n elements. Some 3-element subsets $A_1, A_2, \ldots, A_k$ are chosen such that for all $i \neq j$, A_i and A_j have at most one element in common. Show that there is a subset of A with at least $\sqrt{2n}$ elements containing none of the A_i.
