Further Strategies — problem 14.7

A. Engel — Problem-Solving Strategies · 1998

Let S be a set of n points in space ($n \geq 3$). The segments joining these segments are of distinct length, and r of these segments are colored red. Let m be the smallest integer for which $m \geq 2 \cdot r/n$. Prove that there always exists a path of m red segments with their lengths sorted increasingly (BWM).
